

## Lab 9

### Better Responsive Navigation

#### DESCRIPTION

Starting with the HTML and CSS built during today's lesson, modify the horizontally-arranged navigation links so that they appear as automatically centred tabs in the desktop version.

#### INSTRUCTIONS

1. Resize the page in your browser so that the mobile version of the navigation is not showing (desktop version).
2. Consult the CSS for the prior tutorial that detailed how to build horizontally-arranged, centred tabs from a simple unordered list.
3. Increase the height of the HEADER element so that the navigation can render across the whole page width, below the logo to the top left.
4. Modify the CSS to render the links such that they are automatically centred and that they appear as tabs.
5. When the user hovers over a tab, add some CSS that makes the tab appear like it pops upward slightly (like you are thumbing through a set of physical file folder tabs).
6. Customize the colours and any other visual attributes you'd like in order to make it your own.
